Topology: Exercises 1

Simon Gustafsson

Problem 1

Proof. ($\Rightarrow$) Assume there is a bijection $h : A \to B$. Since A countable, there exists $f : A \to C \subseteq \mathbb{N}$. Let $g := f \circ h^{-1} : B \to C$. Since composition preserves bijections, g is a bijection. Implying cardinality of B and A determined by C. Hence A and B have the same cardinality.

($\Leftarrow$) Assume A and B have the same cardinality. Then there exists a set $C \subseteq \mathbb{N}$ and bijections $f : A \to C$ and $g : B \to C$. Define $h := g^{-1} \circ f : A \to B$. Since f and g are bijections, h is a bijection. $\square$
